SERVICE MANUAL

UHF FM TRANSCEIVERS

IC-F4GT
IC-F4GS

Icom Inc.

INTRODUCTION

This service manual describes the latest service information for the **IC-F4GT and IC-F4GS** at the time of publication.

To upgrade quality, all electrical or mechanical parts and internal circuits are subject to change without notice or obligation.

DANGER

NEVER connect the transceiver to an AC outlet or to a DC power supply that uses more than 16 V. Such a connection could cause a fire hazard and/or electric shock.

DO NOT expose the transceiver to rain, snow or any liquids.

DO NOT reverse the polarities of the power supply when connecting the transceiver.

DO NOT apply an RF signal of more than 20 dBm (100mW) to the antenna connector. This could damage the transceiver's front end.

ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

<**SAMPLE ORDER**>

1130007610 S.IC	µPD3140GS	IC-F4GT	MAIN UNIT	1 pieces
8810009510 Screw	BT M2 x 4 NI-ZU	IC-F4GS	Chassis	10 pieces

Addresses are provided on the inside back cover for your convenience.

IC-F4GT IC-F4GS

REPAIR NOTES

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated turning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 40 dB to 50 dB attenuator between the transceiver and a deviation meter or spectrum analyzer when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

SECTION 1 SPECIFICATIONS

				ETS 300 086	EIA/TIA 603
GENERAL	Frequency coverage			400–430 MHz, 440–470 MHz, 470–500 MHz*1*2, 490–512 MHz*1, 490–520 MHz*2	
	Type of emission			16K0F3E (25 kHz: W-type), 14K0F3E (20 kHz: M-type), 8K50F3E (12.5 kHz: N-type)	
	Number of channels			100 ch (100 channel version, except ETS) 32 ch (16 channels × 2 banks: 2-BANK version), 16 ch (16 channel version)	
	Power supply requirement			7.2 V DC (negative ground; supplied battery pack)	
	Current drain (approx.)	TX	at High	1.55 A	
			at Low	800 mA	
		RX	rated audio	250 mA	
			stand-by	70 mA	
	Frequency stability			±2.0 kHz (W/M-type), ±1.5 kHz (N-type)	±0.00025%
	Usable temperature range			–25˚C to +55˚C	–30˚C to +60˚C (–22˚C to +140˚C)
	Dimensions (proj. not included)			54(W) × 132(H) × 35(D) mm; 2 5/32(W) × 5 3/16(H) × 1 3/8(D) inch	
	Weight (with BP-209)			355 g; 12.5 oz	
TRANSMITTER	Output power			High 4 W Low 1 W	
	Modulation system			Variable reactance frequency modulation	
	Max. freqequency deviation			±5.0 kHz (W-type), ±4.0 kHz (M-type)*3, ±2.5 kHz (N-type)	
	Spurious emissions			0.25 µW @ < 1 GHz, 1.0 µW @ < 1 GHz	73 dBc typical
	Adjacent channel power			70 dB (W/M-type) 60 dB (N-type)	70 dB typical (25 kHz) 60 dB typical (12.5 kHz)
	Transmitter audio distortion			Less than 5% at 1 kHz, 60% deviation	Less than 3% at 1 kHz, 40% deviation
	Limitting charact of modulator			70–100% of max. deviation	
	Ext. microphone connector			3-conductor 2.5(d) mm (1/10")/2.2 kΩ	
RECEIVER	Receive system			Double-conversion superheterodyne system	
	Intermediate frequencies			1st: 46.350 MHz, 2nd: 450 kHz	
	Sensitivity (typical)			0.3 µV at 12 dB SINAD 0.79 µV (emf) at 20 dB SINAD	0.3 µV at 12 dB SINAD
	Squelch sencitivity			0.3 µV typical (at threshold)	
	Adjacent channel selectivity			70 dB (W/M-type) 60 dB (N-type)	75 dB typical (W-type) 65 dB typical (N-type)
	Spurious response			70 dB	70 dB typical
	Intermoduration rejection ratio			65 dB	70 dB typical
	Hum and noise			45 dB typical (W/M-type) 43 dB typical (N-type)	45 dB typical (25 kHz) 40 dB typical (12.5 kHz)
	Audio output power (at 7.2 V DC)			500 mW typical at 5% distortion with an 8 Ω load	
	External SP connector			3-conductor 3.5(d) mm (1/8")/8 Ω	

Measurements made in accordance with EIA/TIA-152-C, 204-D, 603 or ETS 300-086.

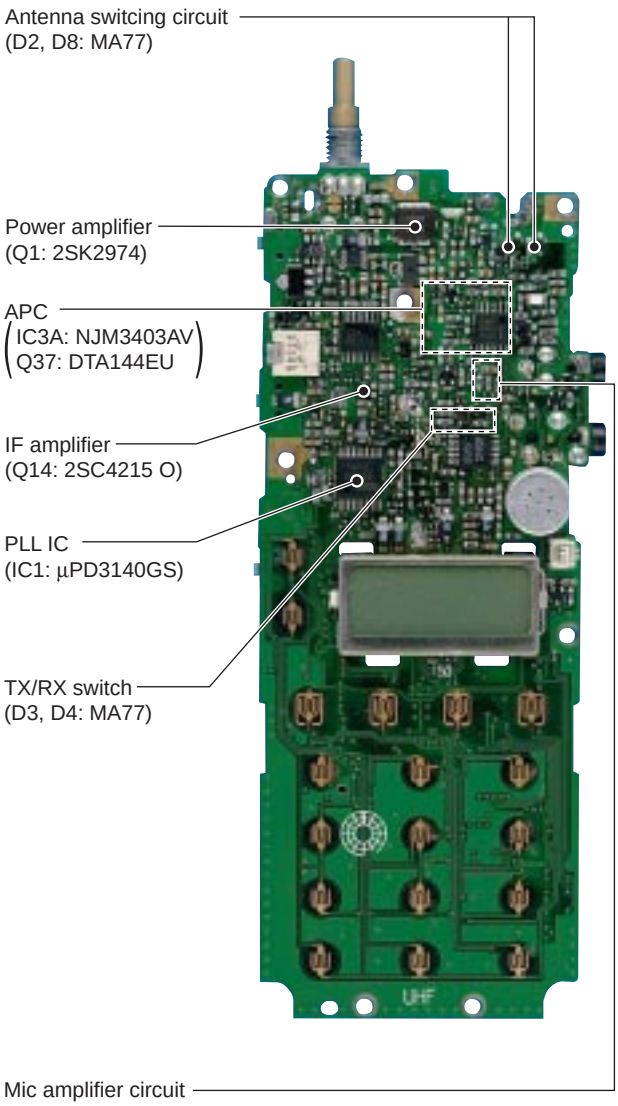
*1EIA/TIA version only, *2General version only, *3ETS/CEPT version only

All stated specifications are subject to change without notice or obligation.

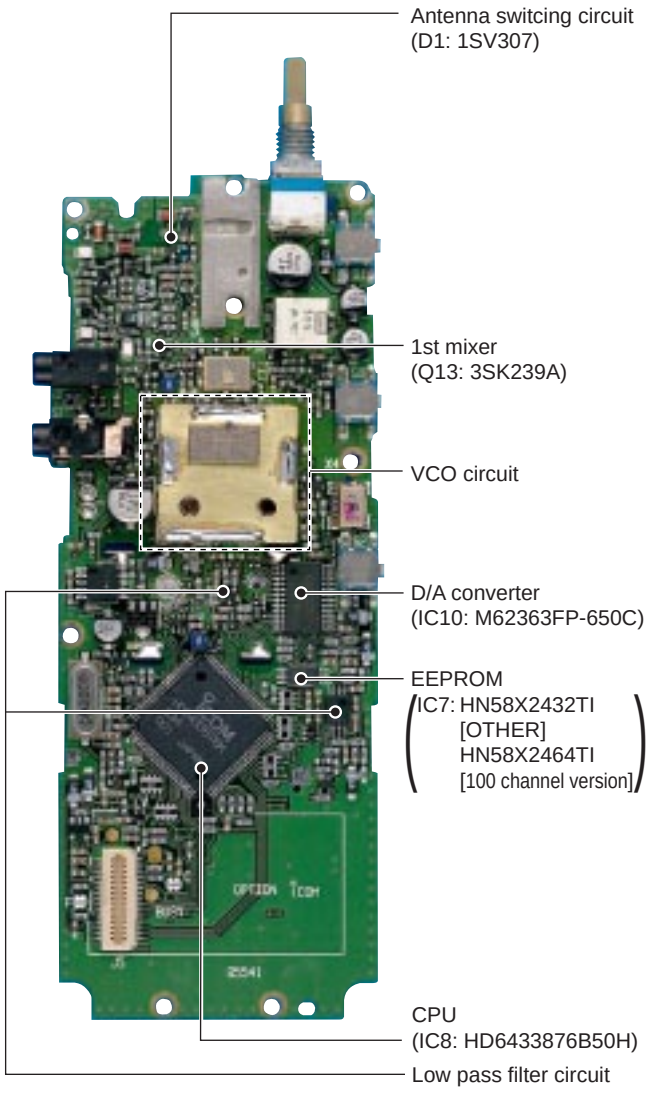
SECTION 2 INSIDE VIEWS

• **MAIN UNIT**

TOP VIEW



BOTTOM VIEW

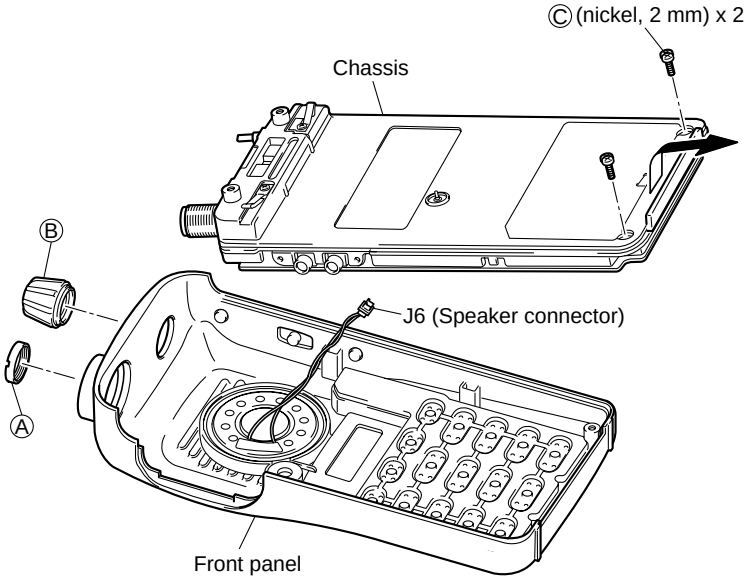


SECTION 3 DISASSEMBLY AND OPTION INSTRUCTIONS

3-1 DISASSEMBLY INSTRUCTION

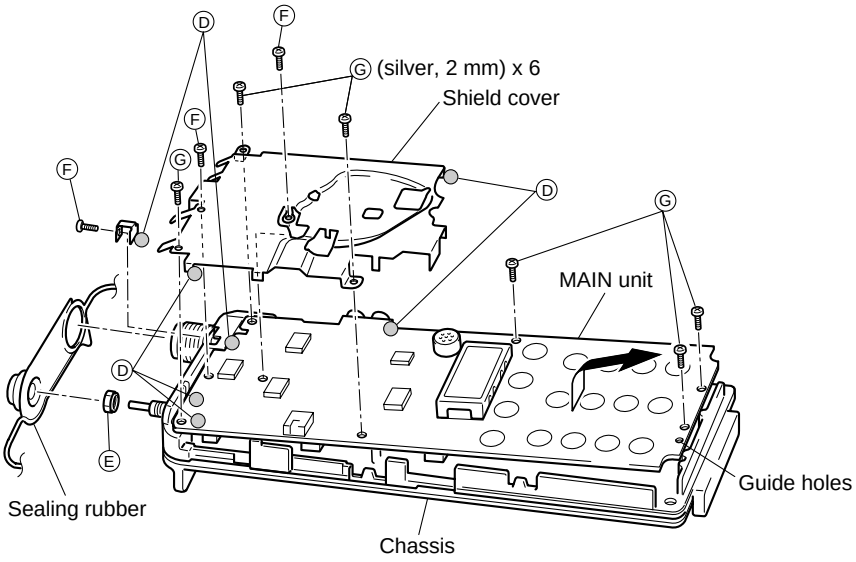
• REMOVING THE CHASSIS PANEL

① Unscrew 1 nut Ⓐ, and remove 1 knob Ⓑ.
② Unscrew 2 screws Ⓒ.
③ Take off the chassis in the direction of the arrow.
④ Unplug J6 to separate front panel and chassis.



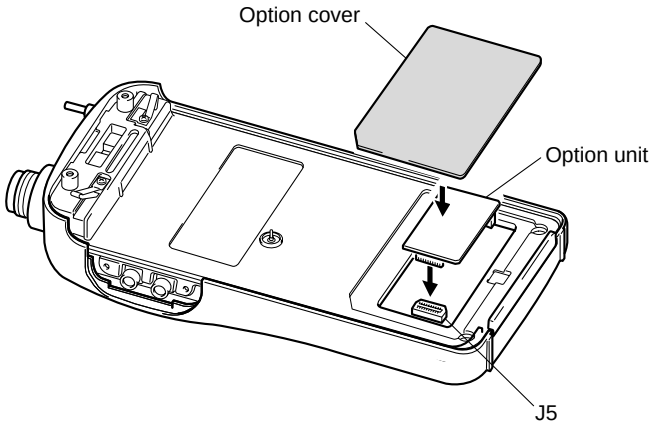
• REMOVING THE MAIN UNIT

① Remove the searing rubber.
② Unsolder 4 points Ⓓ, and unscrew 1 nut Ⓔ.
③ Unscrew 3 screws Ⓕ, and 6 screws Ⓖ (silver, 2 mm) to separate the chassis and the MAIN unit.
④ Take off the MAIN unit in the direction of the arrow.



3-2 OPTIONAL UNIT INSTALLATIONS

① Remove the option cover.
② Connect one of UT-96, UT-105, UT-108, UT-109, UT-110, UT-111, and UT-113 optional units to J5.
③ Replace the option cover to the chassis-hole.



SECTION 4 CIRCUIT DESCRIPTION

4-1 RECEIVER CIRCUITS

4-1-1 ANTENNA SWITCHING CIRCUIT

The antenna switching circuit functions as a low-pass filter while receiving. However, its impedance becomes very high while D2 and D8 are turned ON. Thus transmit signals are blocked from entering the receiver circuits. The antenna switching circuit employs a λ/4 type diode switching system.

Received signals are passed through the low-pass filter (L1, L2, C3, C8, C666). The filtered signals are applied to the λ/4 type antenna switching circuit (D2, D8).
The passed signals are then applied to the RF amplifier circuit.

4-1-2 RF CIRCUIT

The RF circuit amplifies signals within the range of frequency coverage and filters out-of-band signals.

The signals from the antenna switching circuit are amplified at the RF amplifier (Q12) after passing through the tunable bandpass filter (L17, D10, C85, C86). The amplified signals are applied to the 1st mixer circuit (Q13) after out-of-band signals are suppressed at the 3 stages tunable bandpass filter (D401, L18, C89, C406, D11, L402, C91, C92, C94, D12, L19, C97, C98).

Varactor diodes are employed at the bandpass filters that track the filters and are controlled by the CPU (IC8) via the expander IC (IC10) using T1–T4 signals. These diodes tune the center frequency of an RF passband for wide bandwidth receiving and good image response rejection.

4-1-3 1ST MIXER AND 1ST IF CIRCUITS

The 1st mixer circuit converts the received signal into a fixed frequency of the 1st IF signal with a PLL output frequency. By changing the PLL frequency, only the desired frequency will pass through a crystal filter at the next stage of the 1st mixer.

The signals from the RF circuit are mixed at the 1st mixer (Q13) with a 1st LO signal coming from the VCO circuit to produce a 46.35 MHz 1st IF signal.

The 1st IF signal is applied to a pair of crystal filters (FI1) to suppress out-of-band signals. The filtered 1st IF signal is applied to the IF amplifier (Q14), then applied to the 2nd mixer circuit (IC2, pin 16).

4-1-4 2ND IF AND DEMODULATOR CIRCUITS

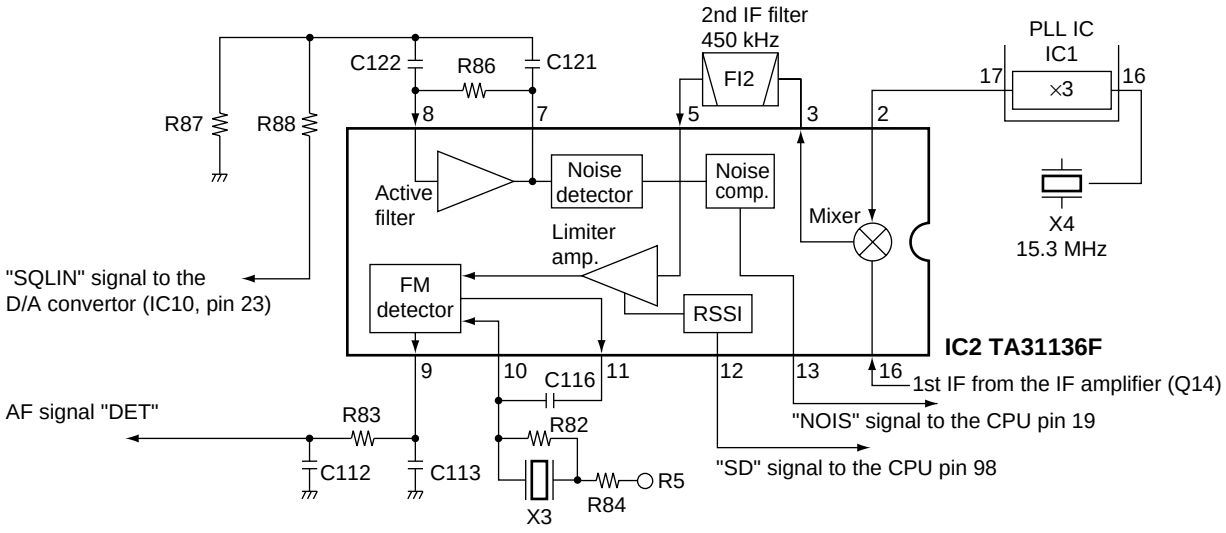
The 2nd mixer circuit converts the 1st IF signal into a 2nd IF signal. A double conversion superheterodyne system (which converts receive signals twice) improves the image rejection ratio and obtains stable receiver gain.

The 1st IF signal from the IF amplifier is applied to the 2nd mixer section of the FM IF IC (IC2, pin 16), and is mixed with the 2nd LO signal to be converted into a 450 kHz 2nd IF signal.

The FM IF IC contains the 2nd mixer, limiter amplifier, quadrature detector and active filter circuits. A 2nd LO signal (30.6 MHz) is produced at the PLL circuit by doubling it's reference frequency.

The 2nd IF signal from the 2nd mixer (IC2, pin 3) passes through a ceramic filter (FI2) to remove unwanted heterodyned frequencies. It is then amplified at the limiter amplifier (IC2, pin 5) and applied to the quadrature detector (IC2, pins 10, 11) to demodulate the 2nd IF signal into AF signals.

• 2ND IF AND DEMODULATOR CIRCUITS



4-1-5 AF CIRCUIT

AF signals from the FM IF IC (IC2, pin 9) are applied to the mute switch (IC4, pin 1) via the AF filter circuit (IC3b, pins 6, 7). The output signals from pin 11 are applied to the AF power amplifier (IC5, pin 4) after being passed through the [VOL] control (R143).

The applied AF signals are amplified at the AF power amplifier circuit (IC5, pin 4) to obtain the specified audio level. The amplified AF signals, output from pin 10, are applied to the internal speaker (SP1) as the “SP” signal via the [SP] jack when no plug is connected to the jack.

4-1-6 SQUELCH CIRCUIT

A squelch circuit cuts out AF signals when no RF signals are received. By detecting noise components in the AF signals, the squelch switches the AF mute switch.

A portion of the AF signals from the FM IF IC (IC2, pin 9) are applied to the active filter section (IC2, pin 8) where noise components are amplified and detected with an internal noise detector.

The active filter section amplifies noise components. The filtered signals are rectified at the noise detector section and converted into “NOIS” (pulse type) signals at the noise comparator section. The “NOIS” signal is applied to the CPU (IC8, pin 19).

The CPU detects the receiving signal strength from the number of the pulses, and outputs an “RMUT” signal from pin 49. This signal controls the mute switch (IC4, pin 13) to cut the AF signal line.

4-1-7 WIDE AND NARROW SWITCHING CIRCUIT

The “NWC” signal from the CPU (IC8, pin 38) is applied to the Q41. Q41 is switched ON or OFF by the signal. Q41 controls IC2’s detector output to same level both wide band mode and narrow band mode.

4-2 TRANSMITTER CIRCUITS

4-2-1 MICROPHONE AMPLIFIER CIRCUIT

The microphone amplifier circuit amplifies audio signals with +6 dB/octave pre-emphasis characteristics from the microphone to a level needed for the modulation circuit.

The AF signals from the microphone are applied to the microphone amplifier circuit (IC3c, pin 10). The amplified AF signals are passed through the low-pass filter circuit (IC3d, pins 13, 14) via the mute switch (IC4, pins 4, 3). The filtered AF signals are applied to the modulator circuit after being passed through the mute switch (IC4, pins 9, 8).

4-2-2 MODULATION CIRCUIT

The modulation circuit modulates the VCO oscillating signal (RF signal) using the microphone audio signal.

The audio signals change the reactance of a diode (D404) to modulate an oscillated signal at the VCO circuit (Q7, Q8). The oscillated signal is amplified at the buffer-amplifiers (Q4, Q6), then applied to the T/R switching circuit (D3, D4).

4-2-3 DRIVE/POWER AMPLIFIER CIRCUITS

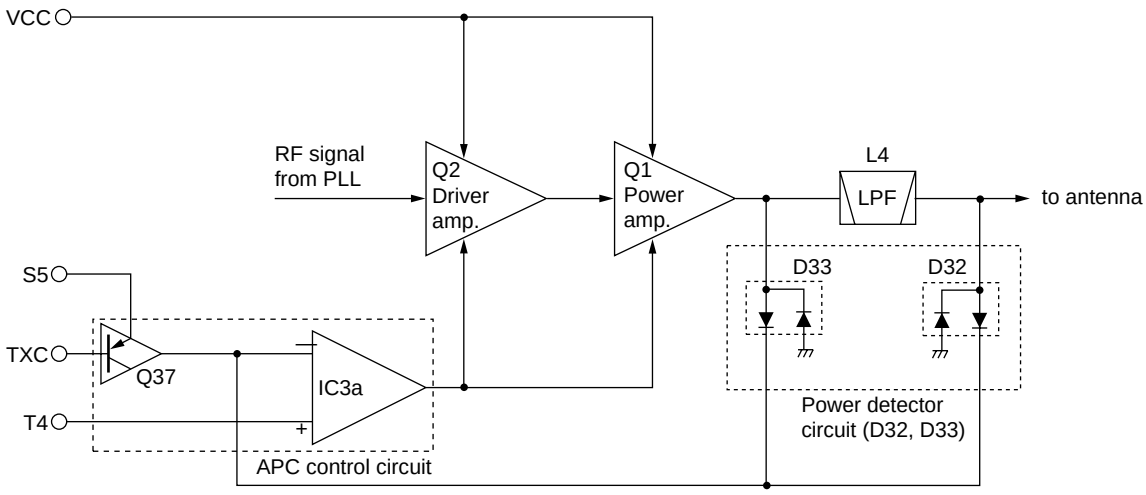
The signal from the VCO circuit passes through the T/R switching circuit (D3) and is amplified at the buffer (Q403, Q3), pre-drive (Q2) and power amplifier (Q1) to obtain 4 W of RF power (at 7.2 V DC). The amplified signal passes through the antenna switching circuit (D1), and low-pass filter and is then applied to the antenna connector.

The bias current of the pre-drive (Q2) and the power amplifier (Q1) is controlled by the APC circuit.

4-2-5 APC CIRCUIT

The APC circuit (IC3a, Q37) protects the drive and the power amplifiers from excessive current drive, and selects HIGH or LOW output power.

• APC CIRCUIT



The signal output from the power detector circuit (D32, D33) is applied to the differential amplifier (IC3a, pin 2), and the "T4" signal from the expander (IC10, pin 11), controlled by the CPU (IC8), is applied to the other input for reference.

When the driving current is increased, input voltage of the differential amplifier (pin 2) will be increased. In such cases, the differential amplifier output voltage (pin 1) is decreased to reduce the driving current.

4-3 PLL CIRCUIT

A PLL circuit provides stable oscillation of the transmit frequency and receive 1st LO frequency. The PLL output compares the phase of the divided VCO frequency to the reference frequency. The PLL output frequency is controlled by the divided ratio (N-data) of a programmable divider.

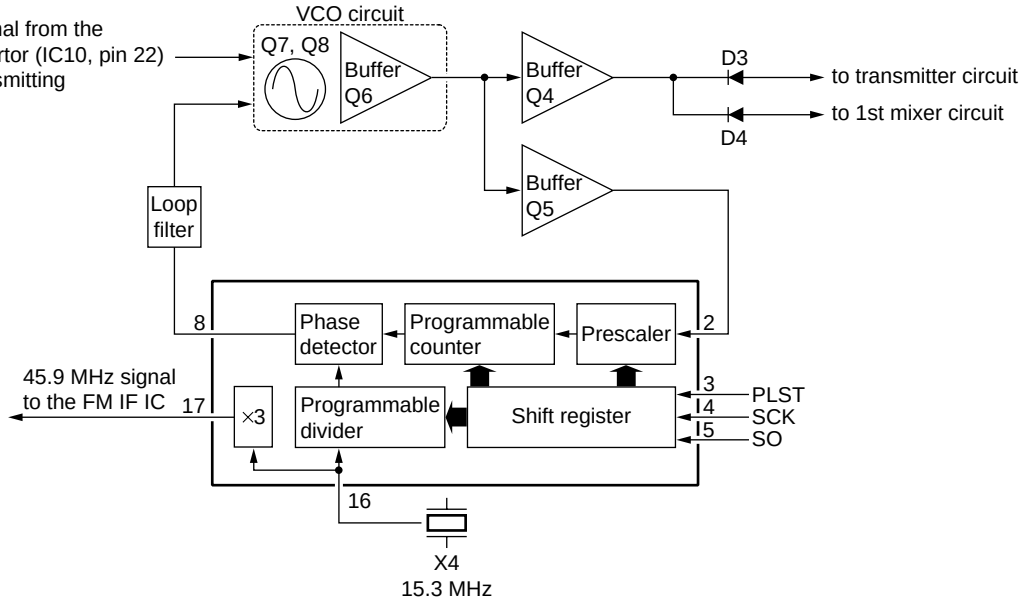
The PLL circuit contains the VCO circuit (Q7, Q8). The oscillated signal is amplified at the buffer-amplifiers (Q6, Q5) and then applied to the PLL IC (IC1, pin 2).

The PLL IC contains a prescaler, programmable counter, programmable divider and phase detector, etc. The entered signal is divided at the prescaler and programmable counter section by the N-data ratio from the CPU. The divided signal is detected on phase at the phase detector using the reference frequency.

If the oscillated signal drifts, its phase changes from that of the reference frequency, causing a lock voltage change to compensate for the drift in the oscillated frequency.

A portion of the VCO signal is amplified at the buffer-amplifier (Q4), and is then applied to the receive 1st mixer (Q13) or transmit buffer-amplifier circuit (Q403) via the T/R switching diode (D3, D4).

• PLL CIRCUIT



4-4 POWER SUPPLY CIRCUITS

VOLTAGE LINE

LINE	DESCRIPTION
HV	The voltage from the attached battery pack.
VCC	The same voltage as the HV line (battery voltage) which is controlled by the power swtich ([VOL] control).
CPU5	Common 5 V converted from the VCC line by the reference regulator circuit (IC6). The output voltage is applied to the CPU (IC8), the 5 V regulator controller (Q20), reset circuit (IC11) and etc.
T5	5 V for transmitter circuits regulated by the T5 regulator circuit (Q22). The output voltage is applied to the low-pass filter (Q35), buffer amplifiers (Q403, Q3) and etc.
R5	5 V for receiver circuits regulated by the R5 regulator circuit (Q21). The output voltage is applied to the low-pass filter (IC12), analog swtich (IC4), 1st mixer (Q13), RF amplifier (Q12), and etc.
S5	Common 5 V converted from the VCC line by the S5 regulator circuit (Q18, Q19). The output voltage is applied to the buffer amplifier (Q36), APC circuit (IC3A, Q37), and etc.
OPT	The same voltage as the CPU5 line for the optional HM-46L, HM-75A or HS-51 through a resistor (R132).

4-5 PORT ALLOCATIONS

4-5-1 CPU (IC8)

Pin number	Port name	Description
1	VIN	Input port for battely voltage detection.
9	RESET	Input port for RESET signal.
11	CSIFT	Outputs reference oscillator for the CPU control signal.
12	SCK	Outputs clock signal to the PLL IC (IC1), EEPROM (IC7), etc.
15	DAST	• Outputs strobe signals to the expander IC (IC10, pin 6). • Input port for the initial version signal.
16	CLIN	Input port for the cloning signal.
17	CLOUT	Outputs the cloning signal.
18	PLST	Outputs strobe signals to the PLL IC (IC1, pin 3).
19	NOIS	Input for for noise signals (pulse type).
21	BUSY	Outputs BUSY detection. Low: The channel is busy.
26, 36, 37	OPV1–3	Input port for the optional unit detection signal from J5.
38	NWC	Outputs Wide/Narrow mode control signal. High: Wide mode is selected.
44–47	KR3–KR0	Output ports for key matrix. Low: When the key is pushed.
49	RMUT	• Outputs RX mute control signal. • Input port for the RX mute signal from optional units.
50	MMUT	• Output TX mute control signal. • Input port for the TX mute signal from optional units.
51	DUSE	Outputs low-pass filter cut-off frequency control signal when DTCS is activated.
52	S5C	Outputs S5 regulator control signal. Low: While power is ON.
53	R5C	Outputs R5 regulator control signal. Low: While receiving.
54	T5C	Outputs T5 regulator control signal. Low: While transmitting.
55	TXC	Outputs APC circuit control signal. High: While transmitting.
56	AFON	Outputs control signal for the regulator circuit of AF power amplifier. High: When squelch is open, etc.
57	LIGT	Outputs LCD backlight control signal. High: Lights ON.
58	ESCK	Outputs EEPROM (IC7, pin 6) clock signal.
59	ESDA	I/O port for data signals from/to EEPROM (IC7, pin 5)

CPU (IC8)–continued

Pin number	Port name	Description
63	UNLK	Input port for unlock signal. High: PLL is unlocked. Low: PLL is locked.
90	MTONE	Output port for: Beep audio while receiving. 2/5-tone signals while transmitting.
91	DTMF	Outputs DTMF tone signal while transmitting.
94	CTCIN	CTCSS/DTCS signals input port for decording.
95	PTT	Input port for the [PTT] switch. High: While [PTT] switch is pushed.
96	BDET	Input port for the battery's type detection.
97	REMO	Input port for the remote-control signal from external MIC (HM-75).
98	SD	Input port for the RSSI detection.
99	LVIN	Input port for the PLL lock voltage.
100	TEMP	Input port for the transceiver's internal temperature detection.

4-5-2 OUTPUT EXPANDER IC (IC10)

Pin number	Port name	Description
2, 3, 10, 11	T1–T4	Output tunable bandpass filter control signals.
6	DAST	Input port for strobe signal from the CPU (IC8, pin 15).
7	SCK	Input port for clock signal from the CPU (IC8, pin 12).

SECTION 5 ADJUSTMENT PROCEDURES

5-1 PREPARATION

When you adjust the contents on page 5-5 or 5-6, SOFTWARE ADJUSTMENT, the optional CS-F3G ADJ ADJUSTMENT SOFTWARE (Rev. 2.0 or later), OPC-478 CLONING CABLE and a JIG CABLE (see illustration at page 5-2) are required.

■ REQUIRED TEST EQUIPMENT

EQUIPMENT	GRADE AND RANGE	EQUIPMENT	GRADE AND RANGE
DC power supply	Output voltage : 7.2 V DC Current capacity : 5 A or more	Audio generator	Frequency range : 300–3000 Hz Output level : 1–500 mV
RF power meter (terminated type)	Measuring range : 1–10 W Frequency range : 300–600 MHz Impedance : 50 Ω SWR : Less than 1.2 : 1	Attenuator	Power attenuation : 40 or 50 dB Capacity : 10 W or more
		Standard signal generator (SSG)	Frequency range : 120–600 MHz Output level : 0.1 µV–32 mV (–127 to –17 dBm)
Frequency counter	Frequency range : 0.1–600 MHz Frequency accuracy : ±1 ppm or better Sensitivity : 100 mV or better	DC voltmeter	Input impedance : 50 kΩ/V DC or better
FM deviation meter	Frequency range : DC–600 MHz Measuring range : 0 to ±5 kHz	Oscilloscope	Frequency range : DC–20 MHz Measuring range : 0.01–20 V
Digital multimeter	Input impedance : 10 MΩ/V DC or better	AC millivoltmeter	Measuring range : 10 mV–10 V

■ SYSTEM REQUIREMENTS

- IBM PC compatible computer with an RS -232C serial port (38400 bps or faster)
- Microsoft Windows 95 or Windows 98
- Intel i486DX processor or faster (Pentium 100 MHz or faster recommended)
- At least 16 MB RAM and 10 MB of hard disk space
- 640×480 pixel display (800×600 pixel display recommended)

■ ADJUSTMENT SOFTWARE INSTALLATION

① Boot up Windows.
 - Quit all applications when Windows is running.
② Insert the cloning software CD-ROM into the apropriate CD-ROM drive.
③ Select 'Run' from the [Start] menu.
④ Type the setup program name using the full path name, then push the [Enter] key. (For example; D:\ setup)
⑤ Follow the prompts.
⑥ Program group 'CS-F3G ADJ' appears in the 'Programs' folder of the [Start] menu.

■ STARTING SOFTWARE ADJUSTMENT

① Connect IC-F4GT/GS and PC with the optional OPC-478 and the JIG cable.
② Boot up Windows, and turn the transceiver power ON.
③ Click the program group 'CS-F3G ADJ' in the 'Programs' folder of the [Start] menu, then CS-F3G ADJ's window is appeared.
④ Click the TCXO tag.
⑤ Click 'Connect' on the CS-F3G's window, then appears IC-F4GT/GS's up-to-date condition.
⑥ Set or modify adjustment data as desired.

			UNIT	LOCATION	
REFERENCE FREQUENCY [TXF]	1	• Operating frequency: 400.000 MHz Ⓐ 440.000 MHz Ⓑ 470.000 MHz Ⓒ 490.000 MHz Ⓓ, Ⓔ • High/Low switch : Low • Connect the RF power meter or 50 Ω dummy load to the antenna connector. • Transmitting	Top panel	Loosely couple a frequnecy counter to the antenna connector.	400.0000 MHz Ⓐ 440.0000 MHz Ⓑ 470.0000 MHz Ⓒ 490.0000 MHz Ⓓ, Ⓔ
OUTPUT POWER [POWER(LO)]	1	• Operating frequency: 415.000 MHz [EUR] of Ⓐ 430.000 MHz [OTHER] of Ⓐ 455.000 MHz [EUR] of Ⓑ 470.000 MHz [OTHER] of Ⓑ 500.000 MHz Ⓒ 512.000 MHz Ⓓ 520.000 MHz Ⓔ • High/Low switch : Low • Transmitting	Top panel	Connect an RF power meter to the antenna connector.	1.0 W
[POWER(HI)]	2	• High/Low switch : High • Transmitting			4.0 W
FM DEVIATION [MOD]	1	• Operating frequency: 400.000 MHz Ⓐ 440.000 MHz Ⓑ 470.000 MHz Ⓒ 490.000 MHz Ⓓ, Ⓔ • High/Low switch : Low • Connect the audio generator to the [MIC] jack and set as: 1.0 kHz/150 mVrms • Set the FM deviation meter as: HPF : OFF LPF : 20 kHz De-emphasis : OFF Detector : (P–P)/2 • Transmitting	Top panel	Connect an FM deviation meter to the antenna connector through the attenuator.	±3.9 kHz*1 [W] ±3.2 kHz [M] ±1.95 kHz*2 [N]
DTCS WAVE FORM [DTCS BAL]	1	• Operating frequency: 430.000 MHz Ⓐ 470.000 MHz Ⓑ 500.000 MHz Ⓒ 512.000 MHz Ⓓ 520.000 MHz Ⓔ • High/Low switch : Low • No audio applied to the [MIC] jack. • DTCS code : 007 • Transmitting	Top panel	Connect an FM deviation meter with an oscilloscope to the antenna connector through an attenuator.	Set to flat wave form 
*1, *2W/N-type must be adjusted both *1 and *2 on the FM DEVIATION ADJUSTMENT.

Ⓐ: 400–430 MHz Ⓑ: 440–470 MHz Ⓒ: 470–500 MHz Ⓓ: 490–512 MHz Ⓔ: 490–520 MHz
[N]: N-type [W]: W-type [M]: M-type

SOFTWARE ADJUSTMENT – continued

Select an operation using [↑] / [↓] keys, then set specified value using [←] / [→] keys on the connected computer keyboard.

ADJUSTMENT		ADJUSTMENT CONDITION	MEASUREMENT		VALUE
			UNIT	LOCATION	
RX SENSITIVITY [BPF T1] – [BPF T4]	1	• Operating frequency: 400.000 MHz Ⓐ 440.000 MHz Ⓑ 470.000 MHz Ⓒ 490.000 MHz Ⓓ, Ⓔ • Connect a standard signal generator to the antenna connector and set as: Frequency : 400.000 MHz Ⓐ 440.000 MHz Ⓑ 470.000 MHz Ⓒ 490.000 MHz Ⓓ, Ⓔ Level : 10 µV* (–87 dBm) Modulation : 1 kHz Deviation : ±3.5 kHz*1 [W] ±2.8 kHz [M] ±1.75 kHz*2 [N] • Receiving	Top panel	Connect a SINAD meter with an 8Ω load to the [SP] jack.	Minimum distortion level
		CONVENIENT: The BPF T1–BPF T4 can be adjusted automatically. ①-1: Set the cursol to "BPF ALL" on the adjustment program and then push [ENTER] key. ①-2: The connected PC tunes BPF T1–BPF T4 to peak levels. or ②-1: Set the cursol to one of BPF T1, T2, T3, or T4 as desired. ②-2: Push [ENTER] key to start tuning. ②-3: Repeat ②-1 and ②-2 to perform additional BPF tuning.			
SQUELCH LEVEL [SQL]	1	• Operating frequency: 400.000 MHz Ⓐ 440.000 MHz Ⓑ 470.000 MHz Ⓒ 490.000 MHz Ⓓ, Ⓔ • Connect a standard signal generator to the antenna connector and set as: Frequency : 400.000 MHz Ⓐ 440.000 MHz Ⓑ 470.000 MHz Ⓒ 490.000 MHz Ⓓ, Ⓔ Level : 0.2 µV* (–121 dBm) Modulation : 1 kHz Deviation : ±3.5 kHz*1 [W] ±2.8 kHz [M] ±1.75 kHz*2 [N] • Receiving	Top panel	Connect a SINAD meter with an 8Ω load to the [SP] jack.	12 dB SINAD
	2	• Receiving			At the point where the audio signals just appears.

*The output level of the standard signal generator (SSG) is indicated as the SSG's open circuit.

*1, *2W/N-type must be set the standard signal generator deviation level both *1 and *2 on the RX SENSITIVITY AND SQUELCH LEVEL ADJUSTMENTS.

Ⓐ: 400–430 MHz Ⓑ: 440–470 MHz Ⓒ: 470–500 MHz Ⓓ: 490–512 MHz Ⓔ: 490–520 MHz

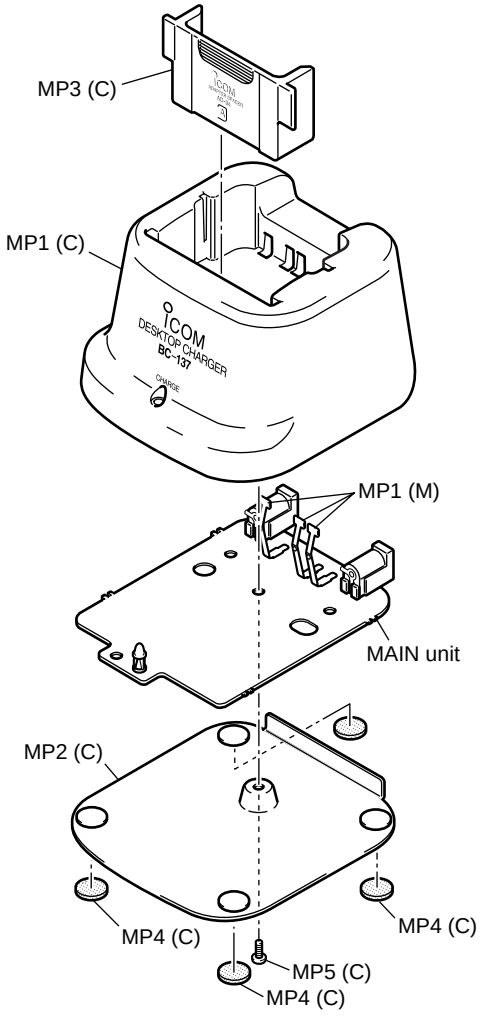
10-2 DISASSEMBLY INFORMATION

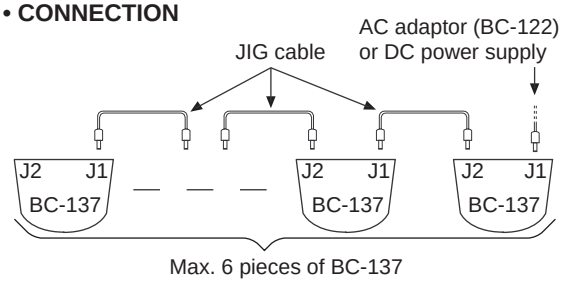


NOTE: (C) : CHASSIS
(M) : MAIN UNIT

CONVENIENT:

BC-137 is connectable max. 6 pieces in parallel.
When connect BC-137 in parallel, JIG cable (as shown below) is required.

• CONNECTION



Max. 6 pieces of BC-137

• JIG CABLE
